

# ECE 321 - Quiz #4 - Name \_\_\_\_\_

## BJT Amplifiers & 2-Port Models

1) BJT Amplifier: DC Analysis. Determine the Thevenin equivalent of R<sub>1</sub> and R<sub>2</sub> as well as the Q-point. Assume ideal silicon transistors:

- |V<sub>be</sub>| = 0.7V
- $\beta = 30$
- $R_e = 900 + 100 \cdot (\text{your birth month}) + (\text{your birth day})$

$R_e$ $900 + 100 \cdot \text{mo} + \text{day}$	$V_b$	$R_b$	$V_{ce}$	$I_c$
<b>1414</b>	<b>3.00V</b>	<b>75k</b>	<b>9.41V</b>	<b>580.6uA</b>

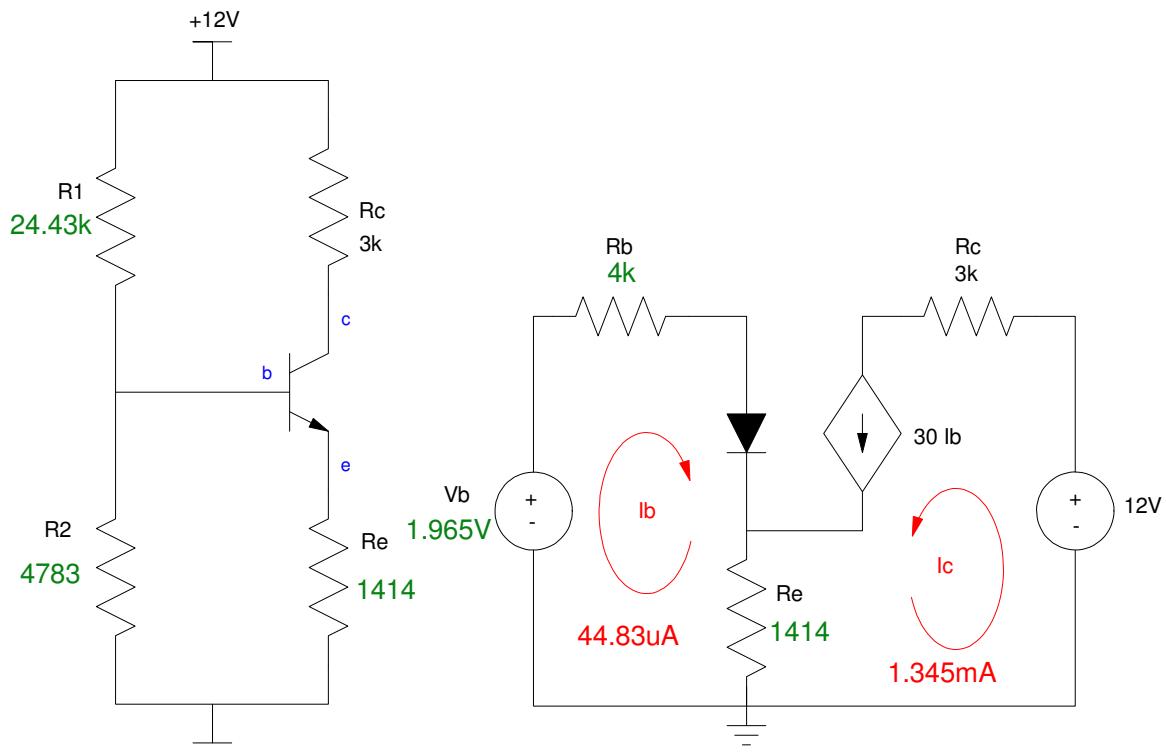

2) BJT Amplifier: DC Design. Determine R<sub>1</sub> and R<sub>2</sub> so that

- The Q point is V<sub>ce</sub> = 6.00V and
- The Q point is stabilized for variations in  $\beta$

Assume

- Ideal silicon transistors ( V<sub>be</sub> = 0.7V,  $\beta$  = 30)
- R<sub>e</sub> = 900 + 100\*(birth month) + (birth day)

R <sub>e</sub> 900 + 100*mo + day	R <sub>1</sub>	R <sub>2</sub>	V <sub>b</sub>	R <sub>b</sub>
<b>1414</b>	<b>24.43k</b>	<b>4783</b>	<b>1.965V</b>	<b>4k</b>

To stabilize the Q-point

$$(1 + \beta)R_e \gg R_b$$

$$43.83k\Omega \gg R_b$$

Let R<sub>b</sub> = 4k

For V<sub>ce</sub> = 6V

$$I_c = \left( \frac{12V - 6V}{3000 + 1414 \left( \frac{31}{30} \right)} \right) = 1.345mA$$

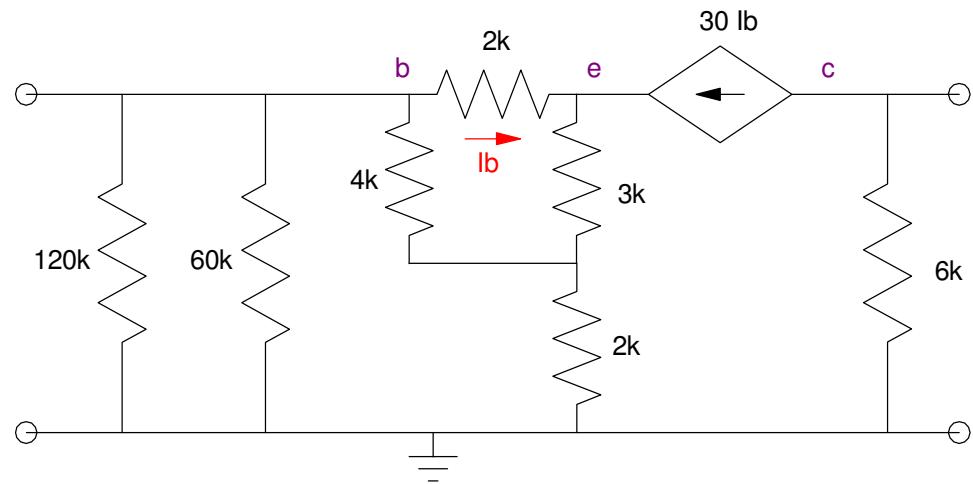

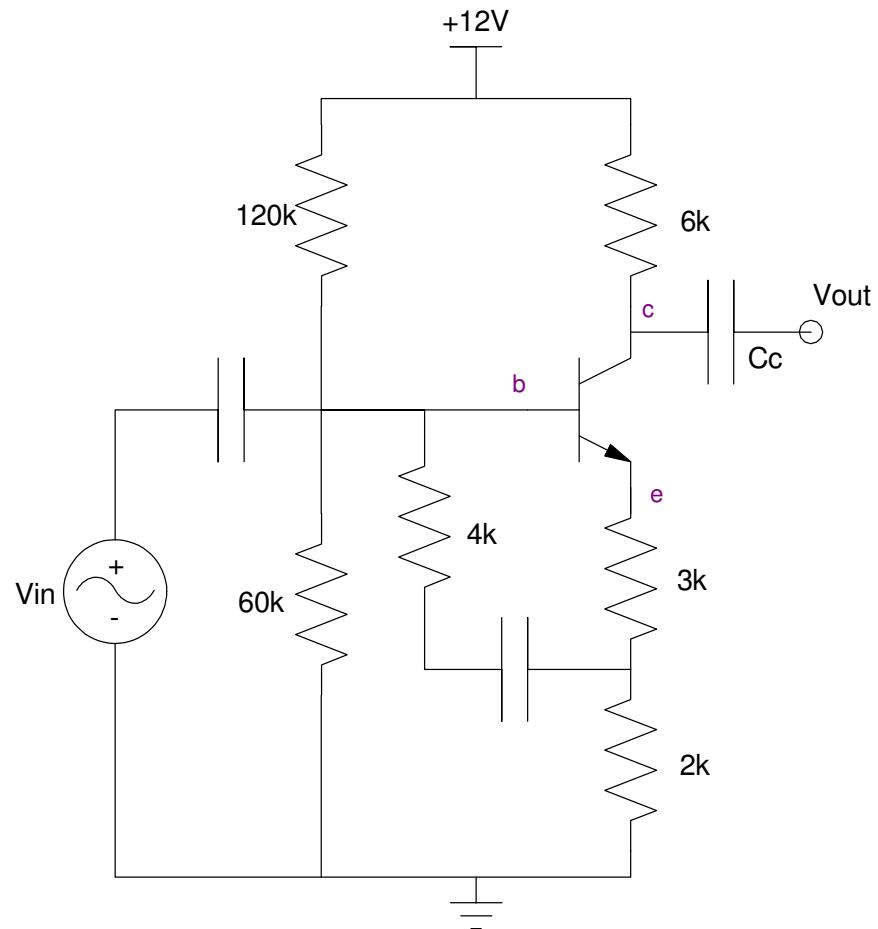

$$I_b = \frac{I_c}{30} = 44.83\mu A$$

$$V_b = R_b I_b + 0.7 + R_e (I_b + I_c) = 1.965V$$

$$R_1 = \left( \frac{12V}{1.965V} \right) R_b = 24.43k\Omega$$

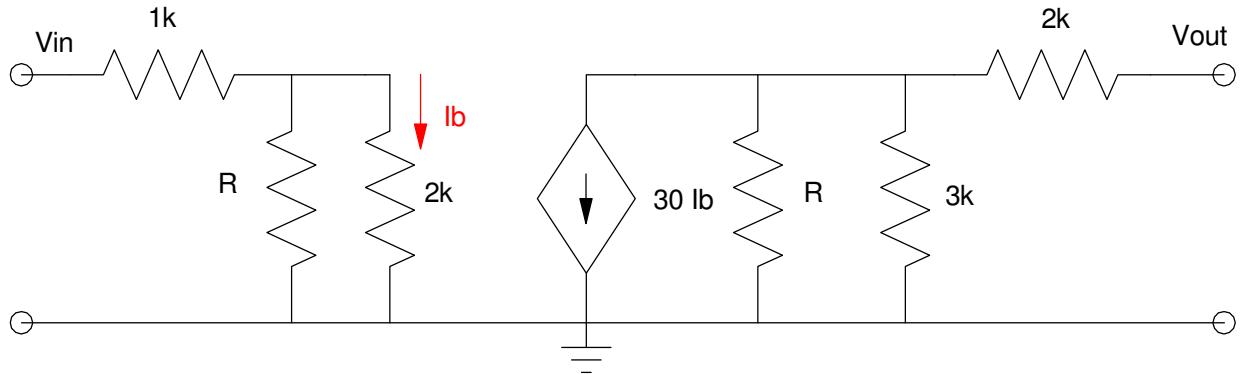

3) BJT: AC Analysis: Draw the small signal model for the following BJT amplifier. Assume

- $r_f = 2000\Omega$
- $\beta = 30$

4) 2-Port Models. Determine the 2-port model for the following circuit:

R 900 + 100*mo + day	Rin	Ain	Rout	Ao
<b>1414</b>	<b>1828</b>	<b>0</b>	<b>2961</b>	<b>-6.53</b>

$$R_{in} = 1k + 1414 \parallel 2000 = 1828$$

$$A_{in} = 0$$

$$R_{out} = 2k + 3k \parallel 1414 = 2961$$

Ao: Set  $V_{in} = 1V$

$$V_b = \left( \frac{828.4}{828.4+1k} \right) 1V = 0.4531V$$

$$I_b = \left( \frac{0.4531V}{2k} \right) = 226.5\mu A$$

$$30I_b = 6.796mA$$

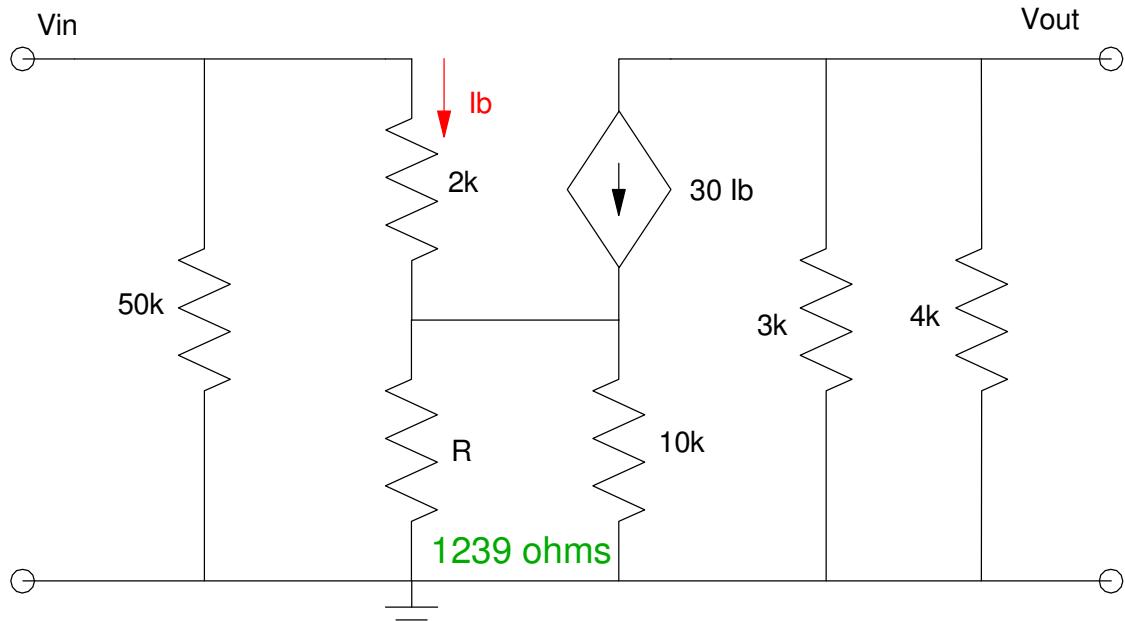

$$V_{out} = -6.796mA \cdot (1414 \parallel 3000)$$

$$V_{out} = -6.531V$$

$$Ao = -6.531$$

5) 2-Port Models. Determine the 2-port model for the following circuit:

R	Rin	Ain	Rout	Ao
$900 + 100 \cdot \text{mo} + \text{day}$	<b>22.35k</b>	<b>0</b>	<b>1714</b>	<b>-1.273</b>

$$R_{in} = 50k \parallel (2k + 31(1239))$$

$$R_{in} = 22.35k\Omega$$

$$A_i = 0$$

$$R_{out} = 3k \parallel 4k = 1714 \text{ Ohms}$$

Ao: Apply 1V to Vin

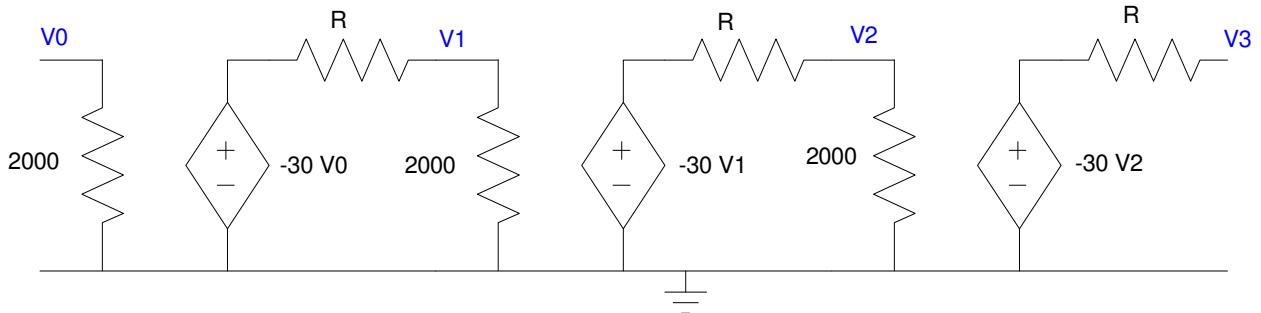

$$I_b = \left( \frac{1V}{2k+31 \cdot 1239} \right) = 24.75\mu A$$

$$I_c = 30I_b = 742.6\mu A$$

$$V_{out} = -(3k \parallel 4k) 742.6\mu A = -1.273$$

6) Determine the 2-port model for three cascaded CE amplifiers

R 900 + 100*mo + day	Rin	Ain	Rout	Ao
<b>1414</b>	<b>2000</b>	<b>0</b>	<b>1414</b>	<b>-9266</b>

Aout: Apply 1V to Vin

$$V_0 = 1V$$

$$V_1 = \left( \frac{2000}{2000+1414} \right) (-30)(V_0) = -17.57V$$

$$V_2 = \left( \frac{2000}{2000+1414} \right) (-30)(V_1) = +308.9V$$

$$V_3 = (-30)V_2 = -9266V$$
